# Humans have altered global nitrogen cycle

Movement and redistribution of reactive nitrogen in land, water, and air.

# What is nutrient bioextraction?

---

- The removal of nutrients from an aquatic ecosystem through the harvest of enhanced biological production (aquaculture of seaweed and/or shellfish)

# Open water seaweed farms

Bronx, NY

Fairfield, CT

Branford, CT  
(Thimble Island Oyster Co.  
DJ King)

# *Saccharina* (sugar kelp, brown seaweed, a winter crop)

- Growing season: Nov. – May (< 15 °C or < 60 °F)
- Kelp is the most widely cultivated species in the world
- Significant potential for the cultured sea vegetable industry in Long Island Sound and the Northeast America
- Human food (rich in calcium, folic acid, iodine, vitamins A,B,D,E, & K; regulates metabolism and aids in weight loss) and source of alginates (colloid & biomedical)
- \*Nutrient bioextraction (ecosystem services)
- Biofuels

## *Saccharina* nursery and open water cultivation

# Productivity (sugar kelp, 2012-2013)

~ 1,752 kg per 100 m longline  
(Dec. – May growing season)

# Productivity (sugar kelp, 2012-2013)

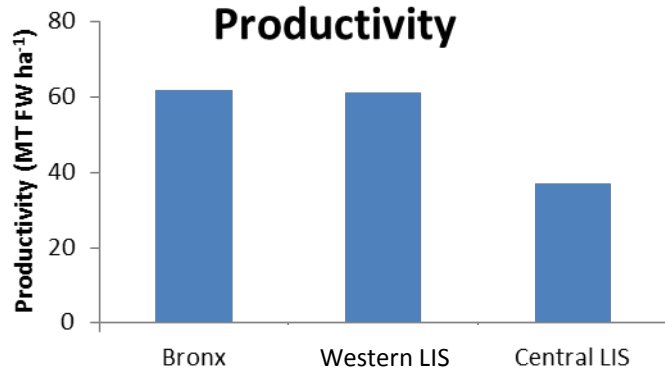

\*29.2 – 116.7 MT FW ha<sup>-1</sup>  
(Dec. – May growing season)

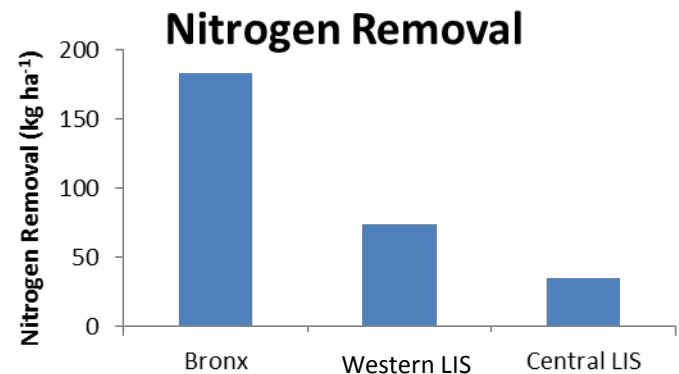

\* Assumption: 1.5 or 6.0 m spacing between longlines (UCONN)

# Productivity, Tissue Nitrogen and Nitrogen Removal

- *Saccharina latissima*
- 2012-2013 growing season
- 1.5 m spacing of lines

## Video Series Shows How to Start Growing Seaweed

Ever wonder what it would be like to grow seaweed? Connecticut Sea Grant has posted a six-part educational video playlist series on YouTube, to show people how to culture and grow four different species of economically important seaweeds. Part One, the introduction to the "Handbook for Seaweed Culture in New England" offers a broad overview of seaweeds and uses in New England. Other chapters describe how to set up a laboratory to culture seaweed, and seaweed nursery culture for native New England species of Kelp, *Gracilaria*, *Chondrus*, and *Porphyra*. The videos are close captioned for accessibility.

This project was funded through NOAA's Sea Grant programs in Connecticut and New Hampshire. Research was conducted at the UConn Marine Biotechnology Laboratory in Stamford (Charles Yarish) and at the University of New Hampshire, Durham (Chris Neefus).
